Course and Curriculum Development

CCE 321 – Civil and Construction Engineering Materials –This course provides information on aggregate, concrete, asphalt, steel/aluminum, and wood materials for construction.

CCE520 – Pavement Design and Sustainability

Changed to CE492/492 – Pavement Structures - It is becoming increasingly apparent that in order to achieve a sustainable transportation network, pavements should be designed by considering not only long-term performance, but also energy efficiency and environmental impacts. This brand new course teaches students how to use methods and software to design pavement structures that are more cost effective, socially beneficial, and does less damage to the environment. The course explores innovative design methods that were developed to investigate distress mechanisms of pavements including alternatives intended to address environmental performance goals. In addition, this course teaches students how to implement pavement design strategies that can have a considerable impact on fuel consumption, recycled asphalt use, vehicle maintenance costs, greenhouse gas (GHG) emissions, and life-cycle costs.

CCE520 – Advanced Pavement Materials – This brand new course teaches students how to design asphalt-aggregate mixtures (Superpave mix design method) to meet performance requirements. Recycling processes for asphalt mixtures and applications of other sustainable asphalt pavement technologies, such as rubberized asphalt, permeable pavements, and warm-mix asphalt, are also discussed. Characteristics of concrete pavement mixture types and concrete pavement construction and durability are also discussed. Environmental impacts of concrete and asphalt pavements’ production, construction, and use phases are also compared towards the end of the term. These comparisons are intended to provide an understanding of the importance of considering the complete pavement life cycle to evaluate environmental impacts.

CE596 – Pavement Evaluation and Management – This new course focuses on:

- pavement distress mechanisms;
- pavement distress surveys;
- pavement maintenance and rehabilitation strategies;
- non-destructive pavement testing and performance backcalculation procedures;
- automated pavement condition survey (APCS) technologies and their integration with pavement management systems (PMS);
- the use of PMS to develop the most sustainable strategies for pavement maintenance and rehabilitation; and
- the use of life cycle cost analysis, life cycle assessment, and environmental criteria in the pavement maintenance and rehabilitation decision-making procedures.
